

EPOXY FURNITURE

Product description

The wood we use to create an epoxy wood table is not sprayed, but coated with beeswax and natural oils to protect and enhance the natural grain. After a few years, if you want it to shine with new splendor, the surface can simply be sanded and then coated with oil.

Each table base is coated stainless steel plate, cut to its edges. This stabilizes and protects the wood. The screws on the legs of the table and other details are also made of stainless steel. This material is traditionally used in furniture production as it does not oxidize, is more durable and retains its appearance for years.
